

PCF Plus Common Features

- Virtual Multi-Axes with IDC
- Large CVM dRAM 64k
- · Large Trace 16k
- · Built-in Ethernet

Control Modes

- Cyclic Synchronous Position-Velocity-Torque (CSP, CSV, CST)
- Cyclic Synchronous Torque with Commutation Angle (CSTCA)
- Profile Position-Velocity-Torque, Interpolated Position (PT, PVT), Homing
- · Indexer, Point-to-Point, CPL
- · Camming, Gearing
- Position, Velocity, Torque

Command Interface

- CANopen® Application Protocol over EtherCAT® (CoE)
- ASCII, Serial Binary, and Discrete I/O
- Stepper or Quad A/B Position Commands
- PWM Position-Velocity-Torque Command
- Master Encoder (Gearing/Camming)
- ±10 V Position-Velocity-Torque

Communications

- EtherCAT
- Ethernet
- UDP, TCP-IP, Modbus-TCP, Ethernet/IP
- RS-232

Feedback

- Dual Absolute
 BiSS, SSI, EnDat
 Absolute A
 - Panasonic™, Sanyo Denki™, Tamagawa™
- Analog Sin/Cos Encoder
- Digital Quad A/B/X Encoder
- Secondary Encoder/Emulated Output
- Digital Halls

I/O

- 1 Analog Input ±10V, 16-bit
- 7 High-Speed Digital Inputs
- 6 High-Speed Digital Outputs
- High-Speed Pulse-at-Position
 SLI Support: DOUT4~6, IN7
- I/O Expansion

Safe Torque Off (STO)

• SIL 3, Category 3, PL e

Dimensions: in [mm]

- NEP: 1.38 x 1.18 x 0.86 in [35 x 30 x 21.8 mm], 1.2 oz [0.034 kg]
- NEP-Z:1.85 x 1.38 x 1.32 in [47 x 35 x 33.6 mm], 2.0 oz [0.057 kg]
- NEP-D:3.83 x 6.05 x 1.77 in [97.2 x 153.7 x 45 mm], 11.5 oz [0.326 kg]
 Optional heatsink weight: 0.58 oz [0.016 kg]

Description

The Nano^{Plus} is the smallest servo drive that Copley offers. It can be mounted directly on the motor or within the robotic joints. This drive complies with the requirements of the robotics, AGV, industrial machinery, medical/life-sciences and aerospace industries. It can be mounted to the user PC boards using either connectors, or it can be soldered into the board.

An optional interface board provides connectors which simplify the integration into customer applications. The Nano has a third party approved STO feature. Opto-isolators provide connections to user wiring and controls.

NEP

NEP-Z

NEP-D

Model	Ic	Ιp	VDC
NEP-090-10	5	10	9~90
NEP-090-70	35	70	9~90
NEP-180-10	5	10	20~180
NEP-180-30	15	30	20~180

Note: The -D & -Z models include the same ratings.

Append -D for Module/Dev Board Assy [-D] Append -Z for Module/OEM Board Assy [-Z] Note: For NEP-090-70-D and NEP-090-180-30-D assemblies, heatsinks are installed at the factory.

ETHERCAT COMMUNICATIONS

EtherCAT is the open, real-time Ethernet network developed by Beckhoff based on the widely used 100BASE-TX cabling system. EtherCAT enables high-speed control of multiple axes while maintaining tight synchronization of clocks in the nodes.

Data protocol is CANopen application protocol over EtherCAT (CoE) based on CiA 402 for motion control devices. More information on EtherCAT can be found on this web-site: http://ethercat.org.

RS-232 COMMUNICATIONS

The serial port is a full-duplex, three-wire (RxD, TxD, SGND) type that operates from 9,600 to 230,400 Baud. It can be used by CME software for drive configuration and setup or it can be used by the external equipment sending ASCII commands.

In the following diagram, the circuit shown is used on the NEP-D and it is recommended for the user's PC boards. It converts the single-ended TTL signals levels in the NEP into the ANSI RS-232 levels which are the standard for serial communications and computer COMM ports.

Use ANSI RS232 Transceiver logic RS232RX and RS232TX.

DIGITAL COMMAND INPUTS: POSITION

STAND-ALONE MODE DIGITAL POSITION-CONTROL INPUTS

NEP works with motion controllers that output pulses to command position. The following formats are supported:

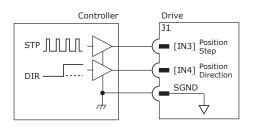

- Step/Direction
 - In Step/Direction mode, a pulse-train controls motor position, and the direction is controlled by a DC level at the Direction input.
- Count-Up/Count-Down (CU/CD)
- CU/CD (Count-Up/Count-Down) signals command the motor to move CW or CCW depending on to which input the pulse-train is directed.
- A/B Quadrature Encoder

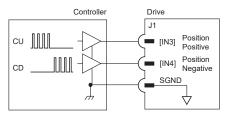

In the A/B Quadrature Encoder mode, the motor can be operated in an electronic gearing mode by connecting the inputs to a Quadrature Encoder on another motor. In all cases, the ratio between input pulses and motor revolutions is programmable.

DIGITAL COMMAND INPUTS: VELOCITY, TORQUE

STAND-ALONE MODE DIGITAL VELOCITY-TORQUE INPUTS

NEP works with the motion controllers that output pulses to the command Velocity or Torque. The following formats are supported:

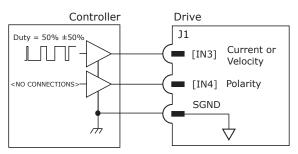

- Pulse/Direction
- In Pulse/Direction mode, a pulse-train with variable duty cycle on IN4 controls Velocity or Torque from $0\sim100\%$.
- -IN5 HI or LO controls the direction of the Velocity or polarity of the Torque.
- PWM 50%
 - In 50% PWM mode, a single signal of 50% duty cycle commands 0% Velocity/Torque.
- -Increasing the duty cycle to 100% commands positive Velocity/Torque.
- -Decreasing the duty cycle to 0% commands negative Velocity/Torque.

HIGH SPEED INPUTS: IN1, IN2, IN3, IN4, IN6, IN7

The six digital inputs to the NEP can be programmed to a selection of functions. All inputs include the following:

- 100 ns RC filters when they are driven by the active sources (CMOS, TTL, etc.).
- 10 k Ω pull-up resistors to +5 Vdc.

INPUT LEVEL FUNCTIONS

- Drive Enable, Enable with Clear Faults, Enable with Reset
- PWM Sync
- Positive Limit Switch
- Negative Limit Switch
- Home Switch
- Encoder Fault
- Motor Temperature Sensor Input
- Motion Abort
- High-Resolution Analog Divide

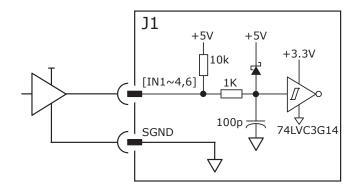

Inputs IN1~4, and IN6 have 100 nanosecond rise time RC filters, each input with a 10 k Ω pull-up resistor to +5 VDC.

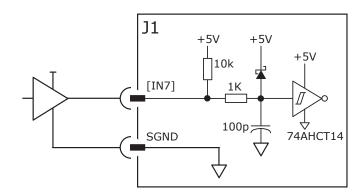

In addition to the selection of functions, the active level for each input is individually programmable. Input level functions have programmable HI or LO to activate the function. Input transition functions are programmable to activate on LO -> HI, or HI -> LO transitions.

INPUT TRANSITION FUNCTIONS

- Clear Faults and Event Latch
- Drive Reset
- PWM Sync Input
- Trajectory Update
- · Count Input Edges, Save to Register
- High-Speed Position Capture
- Simulated Absolute Encoder Burst
- Abort Move if > N Counts From Destination in Register

IN7 has the same input network, but the interface IC is a 74AHCT14BQ powered with 5.0 Vdc.

MOTOR OVERTEMP INPUT: IN5

Input IN5 has a 100 microsecond rise time RC filter, with a 1.6 k Ω pullup resistor to +5 VDC. If it is not used for the Motemp function, IN5 can be re-programmed for other input functions. The input network is the default used for a DIN44081/2 type PTC thermistor mounted in a motor.

IN5_VF has a voltage-to-frequency [V to F] converter. It connects to the FPGA where the frequency decodes to a voltage. By using this converter, it can be configured to work with thermistors to protect motors and/or loads. Use the CME software to select the input to be used for the motor overtemp protection.

CONNECTIONS

Signal	J1 Pins

ENCODER 1 (PRIMARY FEEDBACK)

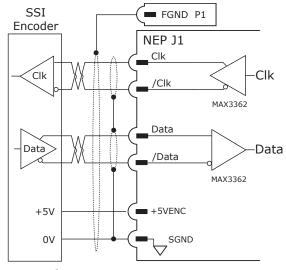

QUAD ENCODER WITH INDEX

SSI ABSOLUTE ENCODER

The SSI (Synchronous Serial Interface) is an interface used to connect an absolute position encoder to a motion controller or control system.

The NEP drive provides a train of clock signals in differential format that are sent to the encoder which initiates the transmission of the position data on the subsequent clock pulses. The number of encoder data bits and counts per motor revolution are programmable. The hardware bus consists of two signals: SCLK and SDATA. The SCLK signal is only active during transfers. Data is clocked in on the falling edge of the clock signal.

BISS ABSOLUTE ENCODER

BiSS is an - Open Source - digital interface for sensors and actuators. BiSS refers to principles of well known industrial standards for Serial Synchronous Interfaces like SSI, AS-Interface® and Interbus® with additional options.

- Serial Synchronous Data Communication
- Cyclic at high speed
- 2 Unidirectional Lines Clock and Data
- -Line delay compensation for high speed data transfer
- -Request for data generation at slaves
- -Safety capable: CRC, Errors, Warnings
- -Bus capability including actuators
- Bidirectional
- -BiSS C-protocol: Continuous mode

Note: Connect Single (outer) shields at the drive end. Connect Inner (shields to the Signal Ground on the drive.

Copley Controls, 20 Dan Road, Canton, MA 02021, USA Tel: 781-828-8090 Fax: 781-828-6547 P/N 16-123146 Rev AB Page 11 of 41

ENCODER 1 (PRIMARY FEEDBACK)

ENDAT ABSOLUTE ENCODER

The EnDat interface is a Heidenhain interface that functions similar to SSI in the use of clock and data signals. In addition, it supports analog Sin/Cos channels from the same encoder.

The number of position data bits are programmable and so are the use of Sin/Cos channels. In the EnDat specification, using the Sin/ Cos incremental signals is optional.

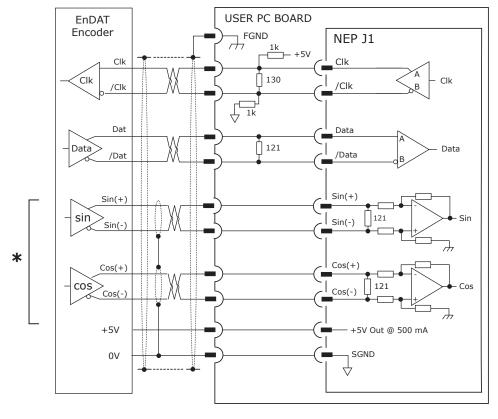

ENDAT SIGNALS

EnDAT	Signal	J1 Pins

+HV CONNECTIONS

POWER SUPPLIES

The drive main power, +HV, is typically supplied by unregulated DC power supplies. These power supplies must be isolated from the mains, and all circuits should be grounded from earth wired to HVCOM at the drive. The +HV power supply connects to P5 and P6. For good wiring practice, the +HV wires should be twisted together for noise suppression, and the power supply should not be grounded. Doing this ensures that the higher currents flowing in these conductors will not flow through any circuit grounds where they might induce noise. During deceleration, mechanical energy in the motor and load is converted back into electrical energy that must be dissipated as the motor comes to a stop.

While some of this is converted to heat in the motor windings, the rest of it will flow through the drive into the power supply. An external storage capacitor should be used if the load has appreciable inertia. It should be sized such that adding the undissipated energy from the motor will not raise the voltage beyond the point at which the drive shuts down. When this is not possible, an external 'dumper', or regenerative energy dissipater must be used which acts as a shunt regulator across the +HV and HVCOM terminals.

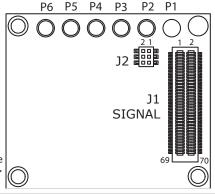

GROUNDING

The P6 connection to ground keeps the +HV power source stable at the drive while the voltage at the power supply (-) varies due to the cable resistance and the +HV current. Grounding at P1 provides a PE (Protective Earth) connection as well as a point to ground the motor cable shields.

Top-view looking into the DEV mother-board ---->

VLOGIC CONNECTIONS

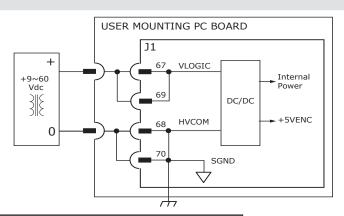

DESCRIPTION

VLOGIC is required for the operation of the drive. It powers the internal logic and the control circuits. Encoder +5V is derived from VLOGIC.

When the STO feature is used, VLOGIC must be produced by power supplies with transformer isolation from the mains and PELV or SELV ratings and a maximum output voltage of 60 Vdc. If the motor can operate from voltages of 60 Vdc or less, the +HV and VLOGIC can be driven from a single power supply.

N.C.	8	N.C.	
	TX1+ TX1- RX1+ N.C. N.C. * RX1- N.C.	TX1+ 1 TX1- 2 RX1+ 3 N.C. 4 N.C. * 5 RX1- 6 N.C. 7	

*Note: In the Signal column, the asterisk indicates the corresponding pin connects to the R/C that is inside the ECAT connector.

Dual RJ-45 sockets accept standard Ethernet cables. The IN port connects to a master, or it connects to the OUT port of a device that is 'upstream' between the NEP and the master.

The OUT port connects to 'downstream' nodes. If the NEP is the last node on a network, only the IN port is used. A terminator is not required on the OUT port.

RUN		ERR

Off	No	(N/A)	= Port Closed

P10~11 EtherCAT PORTS

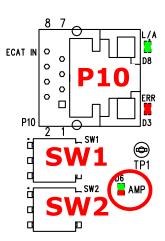

RJ-45 receptacles, 8 position

DRIVE STATUS LED (AMP)

A bi-color LED displays the state of the drive. Colors do not alternate and can be solid On or Blink-ing. If multiple conditions occur, only the top-level condition will be displayed. When that condition is cleared, the next condition in the table is shown.

is dealed, the next condition in the table is shown.			
LED	Condition Description		
RED/BLINKING	Latching fault. Operation cannot resume until the drive is Reset.		
RED/SOLID	Transient fault condition. Drive can resume the operation when the condition causing the fault is removed.		
GREEN/SLOW-BLINKING	Drive OK but NOT-enabled. Can run when enabled.		
GREEN/FAST-BLINKING	Positive or Negative limit switch active. Drive can only move in the direction not inhibited by the limit switch.		
GREEN/SOLID	Drive OK and enabled. Can run in response to reference inputs or EtherCAT commands.		

Copley Controls, 20 Dan Road, Canton, MA 02021, USA Tel: 781-828-8090 Fax: 781-828-6547 P/N 16-123146 Rev AB Page 19 of 41

NEP-D ETHERCAT ADDRESS

EtherCAT DEVICE ID

assigned fixed addresses based on their position on the bus. When a device requires a positive identification that is independent of cabling, a Device ID is needed. In the NEP-D, the Device ID is assigned two, 16-position rotary switches with hexadecimal encoding. These switches can set the Device ID of the drive from 0x01~0xFF (1~255 decimal). In the table, the Decimel column includes the decimal values and the HEX column includes the 2)Subtract (96) from the desired Device ID (107) corresponding hex settings for each switch (SW1 and SW2).

In an EtherCAT network, slaves are automatically For Example 1: To find the switch settings for the Decimal Device ID <u>107</u>, refer to the table to calculate the following

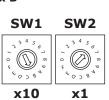

1)In the table SW1 column, find the highest number that is less than 107, (96).

Refer to the SW1 column and set SW1, (96) to the corresponding hex value that appears in the HEX column, (6).

96 < 107 and 112 > 107, so SW1 = 96 = Hex 6

to get the decimal value of switch SW2, (11).
Refer to the SW2 column and set SW2, (11) to the corresponding hex value that appears in the HEX column, (B).

SW2 = (107 - 96) = 11 = Hex B

2

EtherCAT Device ID **Switch Decimel Values**

	SW1	SW2

F	240	15

NEP-D RS-232 CONNECTIONS

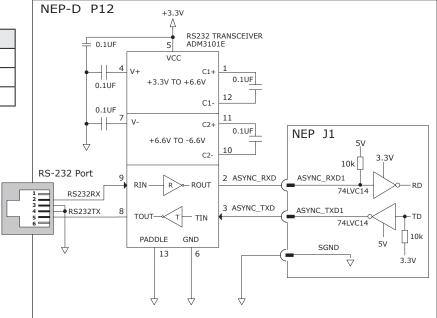

RS-232 CONNECTION

The RS-232 port is used to configure the drive for stand-alone applications, or it is used for configuration before it is installed into an EtherCAT network. The CME software communicates with the drive over this link and it is then used for the complete drive setup. The EtherCAT Device ID that is set by the rotary switches can be monitored, and a Device ID programmed as well.

The RS-232 connector, P12, is a modular RJ-11 type that uses a 6-position plug, four wires of which are used for RS-232. A connector kit is available (SER-USB-RJ11) that includes the modular cable, and an adapter to interface this cable with a 9-pin RS-232 port on a computer.

Pin	Signal	
2	RS232RX1 [RxD]	
3,4	SGND	
5	RS232TX1 [TxD]	

SER-USB-RJ11

The SER-USB-RJ11 device provides connectivity between a USB connector and the RJ-11 connector P12 on the NEP-D board.

Note: The Serial Interface Cable USB to RJ11 (SER-USB-RJ11) can be used to plug-in to either a customer-designed board with an RJ11 or a Copley NEP drive with the NEP-D. When you order either type of board, the Manufacturer recommends you order the Serial Interface Cable USB to RJ11 (SER-USB-RJ11).

Copley Controls, 20 Dan Road, Canton, MA 02021, USA Tel: 781-828-8090 Fax: 781-828-6547 P/N 16-123146 Rev AB Page 20 of 41

NEP-D SAFE TORQUE (STO)

DESCRIPTION

In the following diagram, it shows the use of external 24V to energize the STO inputs. Both STO inputs must be energized in order to enable the drive.

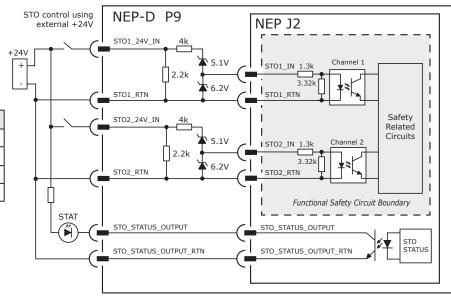

IN1 is the hardware Enable input. It is used with an immediate contact relay to bring the motor to a stop before a delayed contact relay deenergizes the STO inputs and prevents torque production in the motor.

STAT-OUT OPERATION

STO1	0	1	0	1
STO2	0	0	1	1
STAT	0	0	0	1

P9 STO

Signal	Pin		Signal
FGND	1	6	STO_STATUS_OUTPUT
STO1_24V_IN	2	7	STO_STATUS_OUTPUT_RTN
STO1_RTN	3	8	SGND
STO2_24V_IN	4	9	VLOGIC
STO2_RTN	5		

In the STAT_OUT Operation table, the following describes the values.

- STO1 & STO2 rows, 1 = 24V are applied between the IN-24V and RTN. 0 = open-circuit.
- In the STAT row, 1 = the optocoupler is ON, 0 = the optocoupler is OFF.
- STAT output is On (True) when both STO1 & STO2 are energized, allowing the drive to be enabled and to produce torque.

STO OPERATION

STO Input Voltage	STO State
STO1_24V_IN AND STO2_24V_IN ≥ 16 Vdc	STO Inactive. Drive can be enabled to produce torque.
STO1_24V_IN <i>OR</i> STO2_24V_IN < 5.9 Vdc	STO Active. Drive cannot be enabled to produce torque.
STO1_24V_IN OR STO2_24V_IN Open	STO Active. Drive cannot be enabled to produce torque.

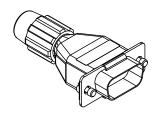

Note: In the above table, the Voltages are referenced between a STOx_24V_IN and a STOx_RTN in P9. For example, V(STO1) = V(STO1_24V_IN) - V(STO1_RTN)

NEP-D SAFE TORQUE OFF (STO) BYPASS

The Bypassing function is used when the user does not require the STO function. The STO-CK-04 has jumpers that use the VLOGIC to energize the STO inputs.

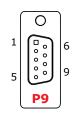

This disables the STO function, allowing the drive to be enabled from hardware inputs or a network. When STO-CK-04 is used, VLOGIC shall use 24 Vdc.

NEP-D +HV, VLOGIC, & MOTOR CONNECTIONS

J4 + HV

The +HV power supply connects to J4 pins 2 & 3. In the following diagram, the shield shown is optional and is primarily used for the reduction of RF emissions originating from the drive. As shown, it connects to the case of the power supply. Note that the minus terminal is not grounded externally. The reason is that currents in the cables produce voltage drops. Grounding the supply at the drive ensures that such voltage drops do not appear in the drive circuits.

J5 MOTOR

Pins 1~3 are used for the motor windings. Pin 4 is used for a cable shield. It connects to the drive heatplate on one end and should connect to the motor frame on the other end. This provides a return path for currents produced by the PWM outputs and the capacitance between the cable conductors, motor windings, and motor frame. While the frame is commonly grounded by mounting it to equipment, without the shield connections the PWM shield, the current could flow into external devices.

P8 VLOGIC

P8 powers the internal logic and control circuits in the drive. When it is used with the STO feature, it must be produced by power supplies with transformer isolation from the mains and PELV or SELV ratings and a maximum output voltage of 60 Vdc. If the motor can operate from voltages of 60 Vdc or less, the +HV and VLOGIC can be driven from a single power supply.

P8 also is the connection point for a motor holding brake. These connect to pins 2 & 3 and is not shown here because it is not part of the power and motor connections. If the STO jumper is used, then 24Vdc shall power the Vlogic P8.

MOT U

SHLD

GROUNDING

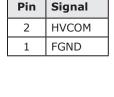

PE and CHASSIS are Protective Earth grounds which are the zerovolt reference for the voltages used in the drive. In addition, they are used as the connection points for fault currents that might flow from any failures in the drive that could expose a user to an electric shock.

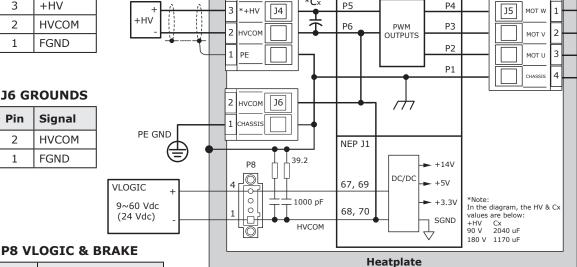

All of these items connect to the drive heatplate and they have no connections to any circuits in the drive. HVCOM, High-Voltage-Common is the OV or 'ground' circuit for the high voltage circuits that drive the motor.

NEP-D VLOGIC & BRAKE CONNECTIONS

In the following diagram, it shows the NEP-D Vlogic and brake connections.

The brake circuit on the NEP-D is MOSFET driven by OUT3 of the NEP.

NEP-D VLOGIC & Brake Diagram

SPECIFICATIONS

Output	Data	Notes
Voltage Range	Max	+9~60 Vdc
Output Current	Ids	1.0 Adc

HI/LO Definitions: Outputs

Input	State	Condition	
LO		Output MOSFET is OFF. Brake is un-powered and locks motor. Motor cannot move. Brake state is Active.	
[DOUT3]	HI	Output MOSFET is On. Brake is powered, releasing motor. Motor is free to move. Brake state is NOT-Active.	

P8 BRAKE

Signal	Pins
Input VLOGIC	4
Brake VLOGIC	3
Brake	2
HVCOM	1

CME Default Setting for the Brake Output [DOUT3] is "Brake - Active Low."

Active = Brake is holding motor shaft (for example, the *Brake is Active*).

Motor cannot move.

No current flows in coil of brake.

CME I/O Line States shows [DOUT3] as LO.

BRK Output voltage is HI (24V), MOSFET is OFF.

Servo drive output current is zero.

Servo drive is disabled, PWM outputs are Off.

Inactive = Brake is not holding motor shaft (for example, the Brake is NOT-Active).

Motor can move.

Current flows in coil of brake.

CME I/O Line States shows [OUT3] as HI.

BRK output voltage is LO (\sim 0V), MOSFET is On.

Servo drive is enabled, PWM outputs are On.

Servo drive output current is flowing.

Refer to the AN136 Accelnet External Regen Application Note, Part Number 16-125661.

Vlogic $+9\sim60.24V$ power is recommended. If using a 24V Brake, 24V is required. If common to HV do not exceed 60V, use REGEN protection and diode isolation from HV.

Copley Controls, 20 Dan Road, Canton, MA 02021, USA Tel: 781-828-8090 Fax: 781-828-6547 P/N 16-123146 Rev AB Page 24 of 41

NEP-D INPUTS & OUTPUTS

INPUTS 1~7

The inputs are described below:

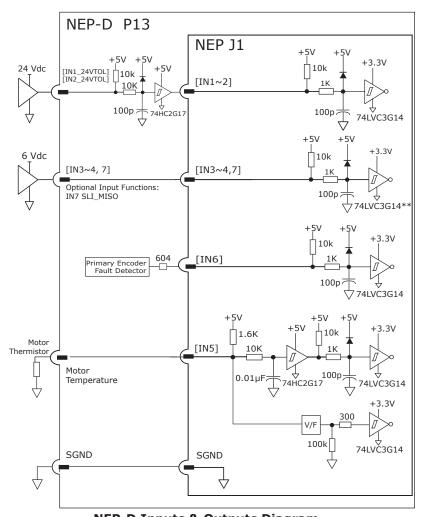

- IN1~2, 24V can tolerate +24 Vdc.
- IN3~4, IN7 can tolerate +6 Vdc.
- IN5 is used to interface a DIN44081/2 thermistor in a motor winding.
- IN6 is for the motor encoder fault.

NEP-D PRIMARY FEEDBACK ENCODER

ENC1 is the Motor encoder. It is used in single-encoder applications. In Dual-encoder applications, it can be assigned as Primary or Secondary using the CME software.

FGND connects to the connector shells which connect to the etch areas surrounding the four mounting holes of the NEP-D. The mounting screws and metal standoffs provide a connection to the equipment chassis which has a connection to earth.

NEP-Z: P12 RS-232

RS-232 CONNECTION

The RS-232 port is used to configure the drive for stand-alone applications, or it can be used for the configuration before it is installed into an EtherCAT network.

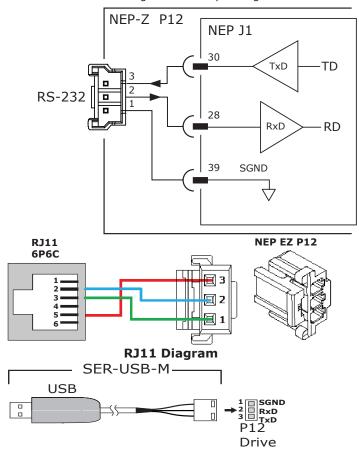

P12 RS-232

Signal	Pin
RX232TX1	3
RS232RX1	2
SGND	1

The RJ-11 socket (6P6C) is compatible with the existing serial-data cables. It can be done using an RJ-11 socket (6P6C) wired with a compatible serial-data cable as shown in the RJ11 Diagram. Molex: 42410-6170 Modular Jack, 6 terminals, size 6

Copley offers a SER-USB-M serial port adapter. This serial port is a full-duplex, three-wire (RxD, TxD, SGND) type that operates from 9,600 to 230,400. The SER-USB-M cable has output levels that are compatible with NEP-Z serial port.

The CME software communicates with the drive over this link. It is then used for the complete drive setup. The EtherCAT Device ID is set via RS-232 along with other operating functions.

NEP-Z: DRIVE STATUS LED (AMP)

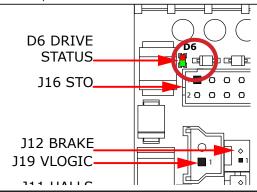

DRIVE STATUS LED (AMP)

A bi-color LED "AMP" displays the state of the drive. Colors do not alternate and can be solid On or BLINKING. If multiple conditions occur, only the top-most condition will be displayed. When that condition is cleared, the next condition in the table is shown.

table is shown.		
LED	Condition Description	
RED/BLINKING	Latching fault. Operation can not resume until the drive is Reset.	
RED/SOLID	Transient fault condition. Drive can resume the operation when the condition causing the fault is removed.	
GREEN/SLOW-BLINKING	Drive OK but NOT-enabled. Can run when enabled.	
GREEN/FAST-BLINKING	Positive or Negative limit switch active. Drive can only move in the direction not inhibited by the limit switch.	
GREEN/SOLID	Drive OK and enabled. Can run in response to reference inputs or EtherCAT commands.	

LATCHING FAULTS

Default	Optional (Programmable)
Short circuit (Internal or External)	Over-voltage
Drive Over-temperature	Under-voltage
Motor Over-temperature	Motor Phasing Error
Feedback Error	Command Input Fault
Following Error	Motor Wiring Disconnected
	Over Current (Latched)

NEP-Z: J9~J10 ETHERCAT COMMUNICATIONS

EtherCAT is the open, real-time Ethernet network developed by Beckhoff based on the widely used 100BASE-TX cabling system. EtherCAT enables high-speed control of multiple axes while maintaining tight synchronization of clocks in the nodes.

ETHERCAT CONNECTIONS

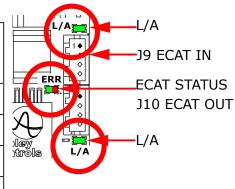

J9 & J10 accept the Ethernet cables. The IN port connects to a master, or it connects to the OUT port of a device that is 'upstream', between the Nano and the master.

Data protocol is CANopen application protocol over EtherCAT (CoE) based on DSP-402 for motion control devices. For additional information on EtherCAT, refer to the web-site: http://ethercat.org/default.htm

The OUT port connects to 'downstream' nodes. If the drive is the last node on a network, only the IN port is used. No terminator is required on the OUT port.

ETHERCAT STATUS LED

RUN		ERR	
GREEN shows the state of the ESM (EtherCAT State Machine).		RED shows errors such as watchdog timeouts and unsolicited state changes in the drive due to local errors.	
Off	= Init State	Off	= EtherCAT communications are working correctly.
BLINKING	= Pre-operational	BLINKING	= Invalid configuration, general configuration error
SINGLE FLASH	= Safe-Operational	SINGLE FLASH	= Local error, slave has changed EtherCAT state autonomously
On	= Operational	Double Flash	= PDO or EtherCAT watchdog timeout, or an application watchdog timeout has occurred.

L/A (LINK/ACT)

Green indicates the state of the EtherCAT network.

LED	Link	Activity	Condition
On	Yes	No	= Port Open
FLICKERING	YES	YES	= Port Open with Activity
Off	No	(N/A)	= Port Closed

ETHERCAT DEVICE ID

In an EtherCAT network, slaves are automatically assigned fixed addresses based on their position on the bus. Stations on EtherCAT are automatically addressed by their bus location. The first drive on the network is station address -1. The second drive is station address -2, and so forth.

ETHERCAT CONNECTORS

In the following RJ-45 diagram, it shows the connections to the EZ Board that use the standard RJ-45 recepticals for their

When a device is required to have a positive identification that is independent of cabling, a Device ID is needed. This Device ID can be set using the digital inputs or set with a programmed value. Use the CME software to configure both of these modes.

network connections. The tables identify the pins and signals for each connector.

NEP-Z: DRIVE AND NETWORK STATUS LEDS

The "STM" microprocessor chip uses the serial port with ASYNC_TXD2 and ASYNC_RXD2 to drive LEDs.

- DR_STATUS_LED_X signals drive the AMP STATUS LED.
- ECAT XXX LED shows the network status of the drive communication.
- ECAT LINKLEDx signals show the presence of activity on the ECAT connections.

In the following diagram, it shows the NEP-Z drive and network status LEDs.

NEP-Z: J16 SAFE TORQUE OFF [STO]

DESCRIPTION

In the following diagram, it shows the use of an external 24V to energize the STO inputs. Both STO inputs must be energized in order to enable the drive.

IN1 is the hardware Enable input. It is used with an immediate contact relay to bring the motor to a stop before a delayed contact relay deenergizes the STO inputs and prevents torque production in the motor.

NEP-Z J16 STO Diagram

Note: In the diagram, the $\pm 24V$ shown can be driven from the VLOGIC power supply. The STOx_24V_IN circuits can tolerate the $\pm 60V$ limit of the VLOGIC input. The STOx_IN maximum voltage limits are ± 7.0 Vdc.

STO_STATUS_OUTPUT

STO1	0	1	0	1
STO2	0	0	1	1
STAT	0	0	0	1

In the STAT-OUT Operation table, the following describes the values.

- STO1 & STO2 rows, 1 = 24V. It is applied between the IN-24V and RTN. 0 = open-circuit.
- In the STAT row, 1 = the optocoupler is ON,
 0 = the optocoupler is OFF.
- STAT output is On (True) when both STO1 & STO2 are energized, allowing the drive to be enabled and to produce torque.

J16 STO

Signal	Р	in	Signal
STO1_RTN	1	2	STO1_24V_IN
STO1_RTN	3	4	STO1_IN
N.C.	5	6	N.C.
STO2_RTN	7	8	STO2_24V_IN
STO2_RTN	9	10	STO2_IN
N.C.	11	12	N.C.
SGND	13	14	STO_STATUS_OUTPUT_RTN
STO_STATUS_OUTPUT	15	16	+5V

STO OPERATION

510 01 210112011	
STO Input Voltage	STO State
STO1_24V_IN <i>AND</i> STO2_24V_IN ≥ 16 Vdc	STO Inactive. Drive can be enabled to produce torque.
STO1_IN <i>AND</i> STO2_IN ≥ 3.0 Vdc	
STO1_24V_IN <i>OR</i> STO2_24V_IN < 5.9 Vdc	
STO1_IN <i>OR</i> STO2_IN ≤ 0.8 Vdc	STO Active. Drive cannot be enabled to produce torque.
STO1_IN OR STO2_IN Open	

Note: In the above table, the Voltages are referenced between a STOx_IN and a STOx_RTN in J16 For example, $V(STO1) = V(STO1_24V_IN) - V(STO1_RTN)$

Copley Controls, 20 Dan Road, Canton, MA 02021, USA Tel: 781-828-8090 Fax: 781-828-6547 P/N 16-123146 Rev AB Page 33 of 41

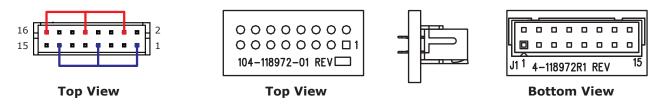

NEP-Z: J16 SAFE TORQUE OFF (STO) BYPASS

The Bypassing function is used when the user does not require the STO function. The NP-Z-STO has jumpers that use the \pm 5VENC to energize the STO inputs.

This disables the STO function, allowing the drive to be enabled from hardware inputs or a network. The following diagrams show the NP-Z-STO top and bottom views.

NEP-Z: J4 +HV & MOTOR CONNECTIONS

J4 +HV: PIN 2, 3

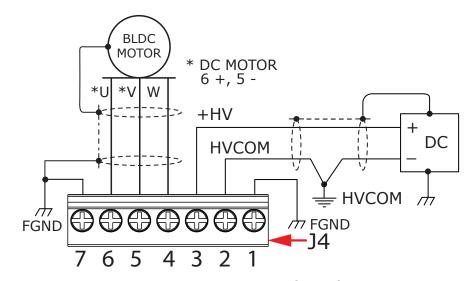

The +HV power supply connects to J4 pins 2 and 3. In the following diagram, it shows the shield. The shield is optional and it is primarily used for the reduction of RF emissions from the drive. As shown, it connects to the case of the power supply. Note that the minus terminal is not grounded externally. This is because currents in the cables produce voltage drops. Grounding the supply at the drive ensures that such voltage drops do not appear in the drive circuits.

J4 MOTOR: PIN 4~6

Pins 4~6 are used for the motor windings. Pin 7 is used for the cable shield. It connects to FGND on one end and it connects to the motor frame on the other end. This provides a return path for currents produced by the PWM outputs and the capacitance between the cable conductors, motor windings, and motor frame. While the frame is commonly grounded by mounting to equipment, without the shield connections, the PWM shield current could flow into external devices.

NEP-Z: J12 BRAKE

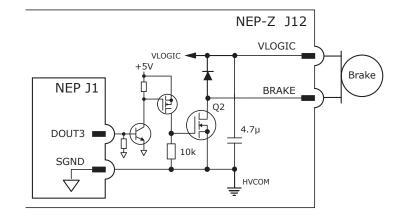

J12 BRAKE:

The EZ board has components that can actuate a brake when it is controlled by DOUT3.

If it is not used for the brake, DOUT3 is programmable for other functions.

HI/LO Definitions: Outputs

Input	State	Condition
BRAKE	LO	Output MOSFET Q2 is OFF. Brake is un-powered and locks motor. Motor cannot move. Brake state is Active.
[DOUT3]	HI	Output MOSFET Q2 is On. Brake is powered, releasing motor. Motor is free to move. Brake state is NOT-Active.

CME Default Setting for Brake Output [DOUT3] is "Brake - Active Low."

Active = Brake is holding motor shaft (i.e. the *Brake is Active*).

Motor cannot move.

No current flows in coil of brake.

CME I/O Line States shows [DOUT3] as LO.

BRK Output voltage is HI (24V), MOSFET Q2 is Off.

Servo drive output current is zero.

Servo drive is disabled, PWM outputs are Off.

Inactive = Brake is not holding motor shaft (i.e. the Brake is NOT-Active).

Motor can move.

Current flows in coil of brake.

CME I/O Line States shows [DOUT3] as HI.

BRK output voltage is LO (~0V), MOSFET Q2 is On.

Servo drive is enabled, PWM outputs are On.

Servo drive output current is flowing.

SPECIFICATIONS

Input	Data	Notes
Voltage Range	Max	+9~60 Vdc
Output Current	Ids	1.0 Adc

J12 BRAKE

Pin	Signal
2	VLOGIC
1	BRAKE

NEP-Z: J19 VLOGIC

J19 VLOGIC:

The J19 VLogic powers the internal logic and control circuits in the drive. When the STO feature is used, it must be produced by the power supplies with the transformer isolation from the mains, PELV or SELV ratings, and provide a maximum output voltage of 60 Vdc.

If the motor can operate from voltages of $60\ \text{Vdc}$ or less, the +HV and VLOGIC can be driven from a single power supply.

SPECIFICATIONS

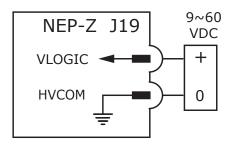

Input	Data	Notes
Voltage Range	Max	+9~60 Vdc
Input Dower	Тур	4 W
Input Power	Max	8 W

Note: The following are the input power values:

- Typical input power is no load on encoder +5V.
- Maximum input power is two encoders @ 250 mA each, and +5V at maximum.

J19 VLOGIC

Pin	Signal
2	VLOGIC
1	HVCOM

Refer to the AN136 Accelnet External Regen Application Note, Part Number 16-125661.

Vlogic $+9\sim60.24V$ power is recommended. If using a 24V Brake, 24V is required. If common to HV do not exceed 60V, use REGEN protection and diode isolation from HV.

Copley Controls, 20 Dan Road, Canton, MA 02021, USA Tel: 781-828-8090 Fax: 781-828-6547 P/N 16-123146 Rev AB Page 35 of 41

NEP-Z: J1 INPUTS & OUTPUTS

- J1 has the following inputs and outputs:
- Digital Inputs 1~7
- Digital Outputs 1~6
- Analog Differential Input
- Secondary Quad A/B/X Encoder Input

J1 LOGIC INPUTS

Signal	Pins

NEP-090-70-Z	Nano ^{Plus} Micro Module with NEP-Z EZ OEM Board, soldered , no Heat Sink
NEP-180-10-Z	Nano ^{Plus} Micro Module with NEP-Z EZ OEM Board, not soldered, no Heat Sink
NEP-180-30-Z	Nano ^{Plus} Micro Module with NEP-Z EZ OEM Board, not soldered, no Heat Sink

ACCESSORIES FOR NANOPLUS MICRO MODULE NEP-D DEVELOPMENT BOARD

Part Number	Description
NP-D-CK	NEP-D Development Board Connector Kit
STO-CK-04	NANO Bypass Jumper for the NEP-D Development Board
N-HK	Heat Sink Kit
SER-USB-RJ11	USB to RJ11 6-pin Modular Adapter

CONNECTOR KIT FOR NEP-D DEVELOPMENT BOARD

	QTY	REF	Name	Description	MFGR Part Number
	1	P8	VLOGIC and	Connector, Terminal Block, 4-pole, 3.5 mm	WAGO: 734-104/107-000
	1	P8	Brake	Tool for Terminal Block	WAGO: 734-231
	1	J3	STO	Backshell, 9 Pin, Metal	3M: 3357-9209
NP-D-CK	1	P9	Feedback	Backshell, 15 Pin, Metal	3M: 3357-9215
Connector	1	J1	I/O	Backshell, 25 Pin, Metal	3M: 3357-9225
Kit	1	J3	STO	Connector, 9 Pin Plug, Metal Shell	AMP: 205204-4
	1	P9	Feedback	Connector, D-Sub, 26 Pin HD, Male, Solder Cup	Norcomp: 180-026-103L001
	1	J1	I/O	Connector, D-Sub, 44 Pin HD, Male, Solder Cup	Norcomp: 180-044-103L001
	9 J3 STO	STO	Contact, Pin, Snap-In, 24~20 AWG	AMP: 66506-9	
	2	J3	STO STO	Jumper, Wire Harness for STO Bypass Terminator	Copley: 103-131505-01

ORDERING GUIDE

ACCESSORIES FOR NANO PLUS MICRO MODULE NEP-Z OEM BOARD

Part Number	Description	
NP-Z-CK	NEP-Z OEM Board Connector Kit	
N-HK	Heat Sink Kit	
SER-USB-M	USB to 3-pin Molex Adapter Cable	

CONNECTOR KIT FOR NEP-Z OEM BOARD						
	QTY	REF	NAME	DESCRIPTION	MFGR PART NUMBER	
	1	J16	STO Bypass	Board Assembly, STO Bypass Board	COPLEY: NP-Z-STO	
	1	J19	VLOGIC	Connector, Socket, single row, 2.00 mm, 2 pos	Molex: 35507-0200	
	1	P12	RS-232	Connector, Socket, single row, 2.00 mm, 3 pos	Molex: 35507-0300	
	1	J17	Primary Feedback	Connector, Socket, single row, 1.25 mm, 14 pos	HIROSE: DF13-14S-1.25C	
	1	J16	STO STO	Connector, Socket, double row, 2.00 mm, 16 pos	HIROSE: DF11-16DS-2C	
	1	J12	Brake	Connector, Socket, single row, 1.25 mm, 2 pos	HIROSE: DF13-2S-1.25C	
	2	J13, J14	CAN	Conn Wire-MT HSG SKT 1x3P, LKG NYL, beige, 1.25 mm	HIROSE: DF13-3S-1.25C	
NP-Z-CK	2	J9, J10	ECAT IN, OUT	Connector, Socket, single row, 1.25 mm, 4 pos	HIROSE: DF13-4S-1.25C	
CONNECTOR	1	J11	Halls	Connector, Socket, single row, 1.25 mm, 5 pos	HIROSE: DF13-5S-1.25C	
Кіт	1	J1	Secondary Fdbk, I/O	Connector, Socket, double row, 2.00 mm, 28 pos	HIROSE: DF11-28DS-2C	
	1	P16, P17	Shields	Connector, positive locking, 26-22 AWG	TE: 353249-2	
	5	J8, J19	Molex Crimps	Crimp, Socket 30-24 AWG, 1.4 mm max. Insulation, Tin	Molex: 501212-8000	
	1	J19	VLOGIC GND	Black Flying Lead with Socket at one end, 24 AWG, gold, 12"	Molex: 050212-8000-12-B4	
	1	J19	VLOGIC	Red Flying Lead with Socket at one end, 24 AWG, gold, 12"	Molex: 050212-8000-12-R4	
	29		DF13 Pins	Connector, Contact, Crimp, 30-26 AWG, 1 mm	HIROSE: DF13-2630SCFA	
	4	P6	DF13 Wires	Black Flying Lead with Sockets at both ends, 26 AWG, gold, 12"	HIROSE: H4BBG-10112-B6	
	17		For DF13	White Flying Lead with Sockets at both ends, 26 AWG, gold, 12"	HIROSE: H4BBG-10112-W6	
	1		Brake Wire	Blue Flying Lead with Sockets at both ends, 26 AWG, gold, 12"	HIROSE: H4BBG-10112-L6	
	3		DF13 Wires	Red Flying Lead with Sockets at both ends, 26 AWG, gold, 12"	HIROSE: H4BBG-10112-R6	
	3		DF11 Wires	Black Flying Lead with Sockets at both ends, 26 AWG, gold, 12"	HIROSE: H3BBG-10112-B6	
	3		DF11 Wires	Red Flying Lead with Sockets at both ends, 26 AWG, gold, 12"	HIROSE: H3BBG-10112-R6	
	20		DF11 Wires	White Flying Lead with Sockets at both ends, 26 AWG, gold, 12"	HIROSE: H3BBG-10112-W6	
	44	J1, J16	DF11 Pins	Connector, Contact, Crimp 28-24 AWG, 1.45 mm	HIROSE: DF11-2428SCA	

REVISION HISTORY

16-123146 Document Revision History

Revision	Date	Remarks
AA	November 30, 2021	Evaluation version, pre-release
AB	May 30, 2024	Update digital output & input values and related information. Add Action Electronics part numbers, and replace P1 with J1 (where applicable). Update new NEP assembly drawing.
